Password is the most sensitive and important aspect with regards to accessing of electronic resources meant only for intended user(s). It is like a key to all your personal and private information stored electronically anywhere.

But just as keys, which could be duplicated and forged, the passwords, if not strong enough, can be forged or hacked. To prevent this, users should be aware to ensure that the passwords they choose are strong enough and create a difficulty for the forgers.

CompuBrainTM guides its clients to ensure that they passwords they choose are strong enough and rather impossible for the forgers to break and use clients' accounts or data for malicious purposes.
