Understanding Data Servers and Mail Servers

Servers are high functionality computers with large amount of space which can be divided and leased out to the clients for hosting their website.

There is a unique numerical IP (Internet Protocol) address for every server on the Internet. Every server has unique and dedicated space leased out for each of the websites. This space can be then be accessed via a specific email address or web address.

Data servers are used mainly to store your backups and other extra information which unnecessarily occupies a lot of space on your hard drives yet may come in use at a necessary stage. Email servers help store your emails from friends, business associates, colleagues, prospective customers inquiring about your latest offerings. We have got it all covered.

At CompuBrainTM dedicated data and email servers are deployed which are functional efficiently 99.99% of the time and secure enough to ensure that your data or emails can be accessed at a time and place of your choice.
